

SABARNO SARKAR

Java Full-Stack Developer | Spring Boot · Angular · GCP · AI-Augmented Dev
+91-7044965877 | sarkarsabarno@gmail.com | [GitHub](#) | [LinkedIn](#) | Mumbai

PROFILE

Java Full Stack Engineer with 3+ years of experience in building enterprise-grade full-stack applications. Experienced in building and integrating frontend and backend components with Angular and Spring Boot, implementing secure APIs, and writing clean, maintainable code, along with demonstrated use of GitHub Copilot (GH300 Certified) and Agentic AI in daily development workflows.

SKILLS & CERTIFICATIONS

Backend: Java, Spring Boot, Microservices, REST APIs, JPA/Hibernate, JWT, Flyway, JDBC

Frontend: Angular (v16+), TypeScript, RxJS, HTML5, CSS3, Highcharts, ApexCharts

Database: SQL, Google BigQuery, JPA, NoSQL (awareness)

AI Tools: GitHub Copilot (GH300 Certified), ChatGPT Codex, Claude Code

Cloud & DevOps: GCP (Certified), Git

Certifications: Google Associate Cloud Engineer · GitHub Copilot GH300 · Udemy Agentic AI (LLM Agents & Automation)

EXPERIENCE

EY Global Delivery Services — Senior Software Engineer Kolkata, India | Aug 2022 – Present

- Addressed the need for scalable enterprise features by architecting and delivering full-stack solutions using Angular (v16+) and Spring Boot microservices, enabling real-time data visualisation for 500+ internal users and improving decision-making efficiency.
 - Mitigated access risks by engineering secure backend systems with JWT authentication and role-based authorisation, safeguarding sensitive business data and eliminating API vulnerabilities across distributed services.
 - Accelerated frontend delivery with the use of GitHub Copilot for code suggestions and code reviews, resulting in faster feature releases and improved user experience as part of the team's adoption of AI-augmented development.
 - Bridged coordination gaps in development by collaborating with cross-functional teams (UX, backend, QA) within an Agile/Scrum framework, improving sprint delivery consistency and adherence to SDLC standards.
 - **Automated complex reconciliation workflows** by architecting **Airflow DAGs** that orchestrated multi-stage **SQL procedures**, reducing manual oversight and ensuring 100% data integrity across distributed enterprise systems.
-

PROJECTS

Trading Application (FinTech)

Spring Boot · JPA · JWT · Flyway · SQL

- Built a financial domain backend system, exposing 15+ RESTful APIs for trade management, user sessions, and business logic — directly applicable to capital markets and fintech platforms.
- Eliminated data inconsistency challenges by designing a robust persistence layer using **JPA/Hibernate and Flyway**, ensuring reliable schema versioning and seamless database migrations across environments.
- Reduced production bugs and improved reliability by developing **unit tests using JUnit**, supporting a test-driven development approach and ensuring stable business logic.
- Optimised data retrieval speed by resolving API performance bottlenecks and reducing subquery overhead.

Data Visualisation Platform (Enterprise Analytics)

Angular · TypeScript · RxJS · REST APIs · SQL

- Engineered a library of reusable Angular components and **RxJS state management**, reducing code duplication across the platform. Used **jVectorMap** for map pointings, and **ApexCharts** for interactive charts to increase visual impact.
- Minimised data latency issues by integrating multiple **REST APIs** for real-time data processing and rendering, supporting **~50 concurrent users** with consistent performance.
- Eliminated manual data loading efforts by building a UI-driven data ingestion feature, enabling business users to upload and manage data independently while reducing operational overhead.

EDUCATION

Kalinga Institute of Industrial Technology — B.E. in Information Technology

2018 – 2022
